

SP-150

**USE WITH HURST SERIES 202 MOTOR MOUNTS IN '35-'40 FORD CHASSIS
SP-150 SPACERS ARE ALSO USED TO GAIN ENGINE-WEIGHT TRANSFER IN
COMPETITION MACHINES**

This spacer is installed between the HURST MOUNT and the top washer of a Ford insulator assembly to raise engine when additional height is required. They are positioned with slot down and the round side inboard. The small stiffener plates go on top of the Mount and under the two 3/8" nuts and washers. When the AD-75 Adjusters are used with the Spacers, they should be put on top of the slot of the spacers with the screw forward so that they pull on the thru-bolt of the insulator.
